DESCRIPTION

Does exposure to environmental toxicants inhibit our ability to have healthy children who develop normally? Biologic markers--indicators that can tell us when environmental factors have caused a change at the cellular or biochemical level that might affect reproductive ability--are a promising tool for research aimed at answering that important question. **Biologic Markers in Reproductive Toxicology** examines the potential of these markers in environmental health studies; clarifies definitions, underlying concepts, and possible applications; and shows the benefits to be gained from their use in reproductive and neurodevelopmental research.
